Objective: To study the effect of Pyelonephritis during pregnancy on mother's quality of Life. **Study design:** descriptive study.

Setting: The study was conducted at outpatient of obstetric department Menufiya University and second setting was Ministry of Health Teaching Hospital. **Subjects:** The subjects of this study were 120 pregnant mothers without any complications rather than pyelonephritis. **Type of sample:** A convenient sample was utilized from both study setting. **The main results:** The study results revealed that, mothers had lack of somatic fitness therefore; they were unable to give care for their families. It is also observed that the majority of the mothers had improper social fitness; they received social support from their family's members. Additionally, they were unhappy with their life changes. More than half of the study sample was psychological upset because they had almost felt sad and afraid of the deterioration and complications of the pyelonephritis. Significant relation was observed between quality of life (QOL) and mother's general characteristics. On the other hand, the score percent of sexual fitness showed insignificant difference (p value=0.54). The mean score of housewives significantly higher than the working women as regard somatic, social, psychological, job and sexual fitness, p values were 0.01, 0.01, 0.001, 0.04 and 0.03 respectively. Study recommended that, outreach program must be designed and implemented to improve QOL among pregnant mother with pyelonephritis, psychological follow up programs for the pregnant mothers with pyelonephritis must be designed and implemented to improve their QOL, and further studies in the area of this study are needed with increasing the sample size in order to generalize the results.
