**this modified technique applied for 30 eyes of 25 patients (40-53 years) with uncontrolled primary open angle glaucoma by medical therapy assigned for surgery. Results: follow up period up to one year revealed significant reduction in intraocular pressure ( IOP ) as p value < .0.001 with complete success in 83.3 % of cases while qualified success in 16.7% of cases . Visual field stability occurred in majority of cases . As regarding the postoperative complications were hyphema 3 cases (10 %) , Descement membrane detachment 2 cases (6.6%) .**
